

## ABSTRACT

METHOD AND APPARATUS FOR THE GENERATION  
OF COMPUTER GRAPHIC REPRESENTATIONS OF INDIVIDUALS

5           Apparatus for generating computer models of  
individuals is provided comprising a booth (1) that is  
connected to a server (2) via the Internet (3). Image  
data of an individual is captured using the booth (1) and  
a computer model corresponding to the individual is then  
10           generated by comparing the captured image data relative  
to a stored generic model. Data representative of a  
generated model is then transmitted to the server (2)  
where it is stored. Stored data can then be retrieved  
via the Internet using a personal computer (4) having  
15           application software stored therein. The application  
software on the personal computer (4) can then utilise  
the data to create graphic representations of an  
individual in any one of a number of poses.
